

Description

Antirrhinum sp. is a genus of plants commonly known as snapdragons from the flowers' fancied resemblance to the face of a dragon that opens and closes its mouth when laterally squeezed (thus the 'snap'). The antirrhinums used to be treated as the family Scrophulariaceae, but studies of DNA sequences have led to the inclusion of *Antirrhinum*

in a vastly enlarged family Plantaginaceae. The word "*Antirrhinum*" is derived from "*antirrhinon*" which in turn was derived from Greek *anti* "like" and *rhis* "nose", inus "of" or "pertaining to". The name literally means "like a nose" in and probably refers to the nose-like capsule in its mature state.

Care Tip

This plant needs lot of sun light, and grow at cool temperatures, temperatures above 70°F (21°C) result in internode elongation, reducing market life. Reducing fertilizer when spike starts to elongate will likely help postproduction life. Well drained, moisture-retaining medium is most beneficial for extending shelf life.
